7. Selected distributions | 7.1 Selected discrete distributions

The Bernoulli distribution

A discrete random variable X is said to be bernoulli-distributed with parameter p (0 < p < 1) if its probability or distribution function, respectively, satisfies:

$$be(x|p) = \begin{cases} 1-p & \text{for } x=0 \\ p & \text{for } x=1 \\ 0 & \text{else} \end{cases} \quad \text{or} \quad Be(x|p) = \begin{cases} 0 & \text{for } x<0 \\ 1-p & \text{for } 0 \leq x < 1 \\ 1 & \text{for } x \geq 1 \end{cases}$$

Hence, it is valid:

$$EX = 0 \cdot (1 - p) + 1 \cdot p = p$$

$$Var X = 0^{2} \cdot (1 - p) + 1^{2} \cdot p - p^{2} = p \cdot (1 - p).$$

Access on the Bernoulli distribution in R:

dbinom(x = c(1,0), size = 1, prob = p)

Ertz | Elements of Statistics

| WiSe 2021/22 2 / 61 © WiSoStat

7. Selected distributions | 7.1 Selected discrete distributions

The Binomial distribution (1)

A discrete random variable X is said to be distributed binomially with parameters n and θ ($n \in \mathbb{N}, 0 < \theta < 1$) if its probability function satisfies:

$$b(x|n,\theta) = \begin{cases} \binom{n}{x} \cdot \theta^x \cdot (1-\theta)^{n-x} & \text{for } x = 0, 1, 2, \dots, n \\ 0 & \text{else} \end{cases}$$

or its distribution function complies with

$$B(x|n,\theta) = \begin{cases} 0 & x < 0 \\ \sum_{\nu=0}^{\lfloor x \rfloor} \binom{n}{\nu} \cdot \theta^{\nu} \cdot (1-\theta)^{n-\nu} & \text{for } x \ge 0 \end{cases}.$$

n balls are drawn with replacement (WR). The probability that x balls of the type of interest are sampled is given by $b(x|n,\theta)$ where θ is the probability associated with each ball.

Ertz | Elements of Statistics

| WiSe 2021/22 3 / 61 © WiSoStat

7. Selected distributions | 7.1 Selected discrete distributions

The Binomial distribution (2)

Since the draws of x balls of the type of interest and n-x balls of the remaining type are independent of each other, we say:

- 1. There are $\binom{n}{x}$ possible combinations to draw the x or rather n-x balls, given the n draws.
- 2. Each and every combination has a probability of $W(x|n,\theta) = \theta^x \cdot (1-\theta)^{n-x}$.

A binomially distributed random variable is the sum of n bernoulli distributed random variables. Since the experiment is performed with replacement, the draws are stochastically independent

$$(X = X_1 + ... + X_n)$$
. Hence:

$$EX = \sum_{i=1}^{n} EX_i = \sum_{i=1}^{n} \theta = n \cdot \theta$$

$$Var X = \sum_{i=1}^{n} Var X_i = \sum_{i=1}^{n} \theta \cdot (1 - \theta) = n \cdot \theta \cdot (1 - \theta) \quad .$$

Notes	

Example 7.1: see ex. 6.4 (1)

Let $\theta = \frac{3}{10} = 0.3$. We then have for n = 3

$$b(0|3;0.3) = {3 \choose 0} \cdot 0.3^0 \cdot 0.7^3 = 0.343$$

$$b(1|3;0.3) = {3 \choose 1} \cdot 0.3^1 \cdot 0.7^2 = 0.441$$

$$b(2|3;0.3) = {3 \choose 2} \cdot 0.3^2 \cdot 0.7^1 = 0.189$$

$$b(3|3;0.3) = {3 \choose 3} \cdot 0.3^3 \cdot 0.7^0 = 0.027$$

Those are the very same probabilities as reported in the previous chapter.

Ertz | Elements of Statistics

7. Selected distributions | 7.1 Selected discrete distributions

Example 7.1: see ex. 6.4 (3)

... as well as

$$Var X = 3 \cdot 0.3 \cdot 0.7 = 0.63.$$

VarX in R:

$$Var <- sum(f_x7_1 * (x7_1 - Mean_X)^2)$$

 Var

[1] 0.63

Alternatively:

$$\label{eq:Var} \mbox{Var} \ \mbox{<- n * Theta7_1 * (1 - Theta7_1)}$$

Ertz | Elements of Statistics

| WiSe 2021/22 7 / 61 © WiSoStat

7. Selected distributions | 7.1 Selected discrete distributions

The multinomial distribution

A discrete random variable X is said to follow a multinomial distribution with parameters n and $\theta_1,...,\theta_k$ (n $\in \mathbb{N}, 0<\theta<1$ and $\theta_1+...+\theta_k=1)$ if its probability function complies to:

$$m(x_1, \dots, x_k | n, \theta_1, \dots, \theta_k) = \begin{cases} \frac{n!}{x_1! \cdot \dots \cdot x_k!} \cdot \theta_1^{x_1} \cdot \dots \cdot \theta_k^{x_k} & \text{for } x_i \in \mathbb{N}_0 \text{ and} \\ x_1 + \dots + x_k = n \\ 0 & \text{else } . \end{cases}$$

In practice, the parameter n of the function m is mostly neglected due to the relation $x_1 + \ldots + x_k = n$.

The binomial distribution is a special case of the multinomial distribution with probabilities $(\theta, 1-\theta)$ associated with the two possible outcomes (x, n-x).

Example 7.2: see Ex. 6.16

Wirtschafts- und Sozialstatistik

Let now $\theta_1=0.3,\,\theta_2=0.2$ and $\theta_3=0.5$ (balls' colours). Then

$$f(1,0) = m(\underbrace{1,0,2}_{=3} | \underbrace{0.3;0.2;0.5}_{=1}) = \frac{3!}{1! \cdot 0! \cdot 2!} \cdot 0.3^{1} \cdot 0.2^{0} \cdot 0.5^{2} = 0.225.$$

f(1,0) (Probability for one red and no white ball) in R:

$$x7_2 \leftarrow c(1, 0, 2); n \leftarrow 3$$

Theta7_2 \lefta c(0.3, 0.2, 0.5)
f_1_0_2 \lefta dmultinom(x7_2, size = n, prob = Theta7_2)
f_1_0_2

[1] 0.225

The probability f(2,2) = m(2,2,0|0.3,0.2,0.5) can be derived from the *else* node of the probability function of the multinomial distribution because of 2+2+0>n.

Ertz | Elements of Statistics

| WiSe 2021/22 9 / 61 © WiSoStat

7. Selected distributions | 7.1 Selected discrete distributions

The hypergeometric distribution

A discrete random variable X is said to follow a hypergeometric distribution with parameters n, M and N (n, M, $N \in \mathbb{N}$ with $n \leq N$ and M < N) if its probability function complies to:

$$h(x|n,N,M) = \begin{cases} \frac{\binom{M}{x} \cdot \binom{N-M}{n-x}}{\binom{N}{n}} & \text{for } x = 0,\dots,n \text{ as well as} \\ & \max(0,M+n-N) \le x \le \min(n,M) \\ 0 & \text{else} \end{cases}$$

M equals the number of balls of the type of interest sampled from an urn containing N balls in total ($\theta = \frac{M}{N}$). Furthermore, n balls are drawn without replacement (WOR). Thus:

$$\mathsf{E}\, X = n \cdot \frac{M}{N} \quad \text{ and } \quad \mathsf{Var}\, X = n \cdot \frac{M}{N} \cdot \left(1 - \frac{M}{N}\right) \cdot \frac{N - n}{N - 1}$$

Ertz | Elements of Statistics

| WiSe 2021/22 10 / 61 © WiSoStat

7. Selected distributions | 7.1 Selected discrete distributions

Example 7.3: Another urn example (1)

Given an urn containing N=100 balls of which M=30 are white. n=3 balls are drawn from the urn **without replacement**. The resulting probabilities are:

$$h(0|3;0.3) = \frac{\binom{30}{0} \cdot \binom{70}{3}}{\binom{100}{3}} = 0.3385$$
 $b(0|3;0.3) = 0.343$

$$h(1|3;0.3) = \frac{\binom{30}{1} \cdot \binom{70}{2}}{\binom{100}{3}} = 0.4481$$
 $b(1|3;0.3) = 0.441$

$$h(2|3;0.3) = \frac{\binom{30}{2} \cdot \binom{70}{1}}{\binom{100}{3}} = 0.1883$$
 $b(2|3;0.3) = 0.189$

$$h(3|3;0.3) = \frac{\binom{3}{3} \cdot \binom{70}{0}}{\binom{100}{3}} = 0.0251 \qquad b(3|3;0.3) = 0.02$$

The Poisson distribution

Notes

Notes

Notes

A discrete random variable X is said to be poisson distributed with parameter λ ($\lambda > 0$) if its probability function satisfies:

$$po(x|\lambda) = \begin{cases} \frac{e^{-\lambda} \cdot \lambda^{x}}{x!} & \text{for } x = 0, 1, \dots \\ 0 & \text{else} \end{cases}$$

We have:

$$\mathsf{E} X = \lambda$$
 and $\mathsf{Var} X = \lambda$.

The poisson distribution is used to model rare events, e.g. natural disasters. In addition to that, it is the limit distribution of the binomial distribution.

7. Selected distributions \mid 7.1 Selected discrete distributions

Example 7.4: Earthquake (1)

Within a certain region an earthquake occurs more or less every ten years. We are interested in the probability that this specific region experiences three earthquakes within one single year.

The information 'once in every ten years' translates to $\lambda=0.1$, hence it follows:

$$\begin{split} P(X \geq 3) &= 1 - W(X \leq 2) = 1 - Po(2|0.1) \\ &= 1 - \left(\frac{0.1^0}{0!} \cdot e^{-0.1} + \frac{0.1^1}{1!} \cdot e^{-0.1} + \frac{0.1^2}{2!} \cdot e^{-0.1}\right) \\ &= 1 - \left(\frac{0.1^0}{0!} + \frac{0.1^1}{1!} + \frac{0.1^2}{2!}\right) \cdot e^{-0.1} \\ &= 1 - 1.105 \cdot e^{-0.1} \\ &\approx 0.000155 \,. \end{split}$$

Interrelation between poisson and bind distribution

We have:

$$\lim_{n\to\infty}b(x|n,\theta)=po(x|\lambda)$$

where $\lambda = n \cdot \theta$. Thus the expected values are in are approximatively identical..

Example 7.5:

Suppose $\lambda = 2 = n \cdot \theta$:

Distribution	X=0	X = 1	X = 2	X = 3	X = 4	X = 5	<i>X</i> = 6	$\operatorname{Var} X$
b(x 10; 0.2)	0.107	0.268	0.302	0.201	0.088	0.026	0.006	1.6
b(x 50;0.04)	0.130	0.271	0.276	0.184	0.090	0.035	0.011	1.92
b(x 100; 0.02)	0.133	0.271	0.273	0.182	0.090	0.035	0.011	1.96

Interrelation between binomial and hypergeometric distribution

The distributions differ due to drawing with/without replacement. For smaller samples (n/N) we thus have negligible differences.

Example 7.6:

For n = 6 and M/N = 0.2 we get:

Distribution	X = 0	X = 1	X = 2	<i>X</i> = 3	X = 4	X = 5	X = 6	$\operatorname{Var} X$
h(x 6,25,5)	0.219	0.438	0.274	0.064	0.005	0.000	0.000	0.76
h(x 6,50,10)	0.242	0.414	0.259	0.075	0.010	0.001	0.000	0.862
h(x 6, 100, 20)	0.252	0.403	0.252	0.079	0.013	0.001	0.000	0.912
h(x 6,200,40)	0.257	0.398	0.249	0.080	0.014	0.001	0.000	0.936
h(x 6,500,100)	0.260	0.395	0.247	0.081	0.015	0.001	0.000	0.950
h(x 6, 100, 200)	0.261	0.394	0.246	0.082	0.015	0.001	0.000	0.955
b(x 6,0.2)	0.262	0.393	0.246	0.082	0.015	0.002	0.000	0.96

An approximation of the hypergeometric distribution with the Poisson distribution can be done in two steps using the binomial distribution.

Ertz | Elements of Statistics

| WiSe 2021/22 17 / 61 © WiSoStat

7. Selected distributions | 7.2 Selected continuous distributions

The exponential distribution

A continuous random variable X is said to be exponentially distributed with parameter λ ($\lambda > 0$) if its density function satisfies:

$$f(x|\lambda) = \begin{cases} \lambda \cdot \exp\left(-\lambda \cdot x\right) & \text{for } x > 0\\ 0 & \text{else} \end{cases}$$

We have:

$$\mathsf{E} X = rac{1}{\lambda}$$
 and $\mathsf{Var} X = rac{1}{\lambda^2}$

The exponential distribution is used to model lifespans, e.g. the one of light bulbs. It is a distribution *without* memory (see Schira 2005, p. 365.)

Access on the exponential distribution in R:

Ertz | Elements of Statistics

| WiSe 2021/22 18 / 61 © WiSoStat

7. Selected distributions | 7.2 Selected continuous distributions

The normal distribution

A continuous random variable X is called normally distributed with parameters μ and σ^2 ($\mu \in \mathbb{R}$ and $\sigma > 0$), if it exhibits the following density function:

$$\varphi(x|\mu,\sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\Big(-\frac{(x-\mu)^2}{2\sigma^2}\Big) \qquad \text{ for all } x \in \mathbb{R} \,.$$

We use the short hand $N(\mu, \sigma^2)$.

We have:

$$\mathsf{E} X = \mu$$
 and $\mathsf{Var} X = \sigma^2$

The expected value and the variance are the explicit parameters of the normal distribution.

Ertz | Elements of Statistics

| WiSe 2021/22 19 / 61 © WiSoStat

7. Selected distributions | 7.2 Selected continuous distributions

Example 7.7: Normal distributions (1)

In the following, we will illustrate the normal distributions N(0,1), N(5,1), $N(-3,0.35^2)$ and $N(5,2^2)$ graphically.

Density function of the normal distribution in R:

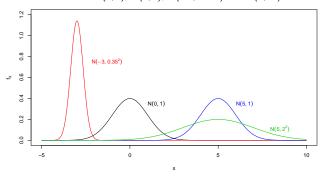

$$x7_{-}7 \leftarrow seq(from = -5, to = 10, by = 0.00001)$$
 $f_{-}x7_{-}7_{-}1 \leftarrow dnorm(x = x7_{-}7, mean = 0, sd = 1)$
 $f_{-}x7_{-}7_{-}2 \leftarrow dnorm(x = x7_{-}7, mean = 5, sd = 1)$
 $f_{-}x7_{-}7_{-}3 \leftarrow dnorm(x = x7_{-}7, mean = -3, sd = 0.35)$
 $f_{-}x7_{-}7_{-}4 \leftarrow dnorm(x = x7_{-}7, mean = 5, sd = 2)$

7. Selected distributions \mid 7.2 Selected continuous distributions

Properties of the normal distribution

- 1. The normal distribution is symmetric to the axis $x = \mu$.
- 2. The graph of the normal distribution reaches its maximum at the point
- 3. The inflexion points of the normal distribution are at $x=\mu-\sigma$ and $x = \mu + \sigma$.
- 4. The distribution function of the normal distribution

$$\Phi(x|\mu,\sigma^2) = \int\limits_{-\infty}^{x} \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(s-\mu)^2}{2\sigma^2}\right) ds$$

cannot be given in a closed-form expression.

Wirtschafts- und Sozialstatistik Universität Trier

Standard normal distribution and standard transformation

If $X \sim N(\mu, \sigma^2)$, then $Z = \frac{X - \mu}{\sigma} \sim N(0, 1)$, where N(0, 1) is the standard normal distribution.

Particularly $P(x_1 < X \le x_2) = P(z_1 < Z \le z_2) = \Phi(z_2) - \Phi(z_1)$, with $z_1 = \frac{x_1 - \mu}{\sigma}$ and $z_2 = \frac{x_2 - \mu}{\sigma}$.

Example 7.8: Standard normal distribution (1)

Using tabulated values of the standard normal distribution or $\mathsf{R},$ we reach:

$$\begin{array}{lll} \Phi(1) = 0.8413 & \Phi(1.96) = 0.9750 & \Phi(3.29) = 0.9995 \\ \Phi(-1) = 1 - \Phi(1) = 0.1587 & \Phi(-1.96) = 0.0250 & \Phi(-3.29) = 0.0005 \end{array}$$

$$\Phi(1.96) = 0.9750$$

$$\Phi(3.29) = 0.9995$$

[1] 0.8413 0.9750 0.9995 0.1587 0.0250 0.0005

Notes

Notes

Notes

Example 7.8: Standard normal distribution (2)

)
Wirtschafts- und Sozialstatisti

From this, we obtain the following probabilities:

$$P(1 \le Z \le 2) = \Phi(2) - \Phi(1)$$

$$= 0.9772 - 0.8413 = 0.1359$$

$$P(-2 \le Z \le -1) = \Phi(-1) - \Phi(-2) = 1 - \Phi(1) - (1 - \Phi(2))$$

$$= 0.1359$$

$$P(-2 \le Z \le 1) = \Phi(1) - (1 - \Phi(2)) = \Phi(1) + \Phi(2) - 1$$

$$= 0.8185$$

$$P(Z \ge -1) = 1 - \Phi(-1) = 1 - (1 - \Phi(1)) = \Phi(1)$$

$$= 0.8413$$

Calculation of $P(1 \le Z \le 2)$ in R:

 $\label{eq:prob7_8} $$\operatorname{Prob7_8} \leftarrow \operatorname{pnorm}(q=2, mean=0, sd=1) - \operatorname{pnorm}(q=1, mean=0, sd=1) \\ \operatorname{round}(\operatorname{Prob7_8}, \ \operatorname{digits=4}) $$$

7. Selected distributions \mid 7.2 Selected continuous distributions

Linear functions of normally distributed random variables

Let the random variables X_1,\ldots,X_n all be $N(\mu_i,\sigma_i^2)$ $(i=1,\ldots,n)$ distributed and overall stochastically independent. Then the linear combination

$$Y = a_0 + a_1 \cdot X_1 + \ldots + a_n \cdot X_n$$

is normally distributed with

$$N\left(a_0 + \sum_{i=1}^n a_i \cdot \mu_i; \quad \sum_{i=1}^n a_i^2 \cdot \sigma_i^2\right)$$

Particularly, the arithmetic mean of identically distributed variables $(X_i \sim N(\mu; \sigma^2))$ is

$$N\left(\mu; \frac{\sigma^2}{n}\right)$$

distributed.

Ertz | Elements of Statistic

| WiSe 2021/22 30 / 61 © WiSoStat

7. Selected distributions | 7.2 Selected continuous distributions

Wirtschafts- und Sozialstatisti

Example 7.11: Linear combination

Let the random variables X_1 , X_2 , X_3 be $N(2;1^2)$, $N(5;2^2)$ and $N(8;3^2)$ distributed and stochastically independent. Furthermore, let

$$Y = 30 + 5X_1 + 2X_2 - 5X_3 \quad .$$

We get

E
$$Y = 30 + 5 \cdot 2 + 2 \cdot 5 - 5 \cdot 8 = 10$$

and

Var
$$Y = 5^2 \cdot 1^2 + 2^2 \cdot 2^2 + (-5)^2 \cdot 3^2 = 266$$
.

Therefore, Y is N(10; 266) distributed.

Notice the difference:

An interviewer questions 10 people or he questions one person and replicates the result 10 times.

The F distribution (1)

Let the random variables Y_1 and Y_2 be χ^2 -distributed with k_1 and k_2 degrees of freedom, respectively. Then, the random variable

$$X = \frac{Y_1/k_1}{Y_2/k_2}$$

follows an F-distribution with (k_1, k_2) degrees of freedom.

7. Selected distributions | 7.2 Selected continuous distributions

The F distribution (2)

| WiSe 2021/22 40 / 61 © WiSoStat

We have:

$$EX = \frac{k_2}{k_2 - 2} \quad \text{for } k_2 > 2$$

$$VarX = \frac{2(k_1 + k_2 - 2)}{k_1(k_2 - 4)} \left(\frac{k_2}{k_2 - 2}\right)^2 \quad \text{for } k_2 > 4$$

Furthermore, we have

$$f(p; k_1, k_2) = \frac{1}{f(1-p; k_2, k_1)}$$

for the p- and (1-p)-quantile of the F distribution, respectively.

Access on the F distribution in R:

$$df(x, df1 = k_1, df2 = k_2)$$

Notes Notes Notes Notes

Law of large numbers

Notes

Bernoulli's law of large numbers

Assume $\{X_n\}$ to be a sequence of binomially distributed random variables with parameters n and θ (0 < θ < 1). This sequence $\{X_n\}$ satisfies the weak law of large numbers if

$$\lim_{n\to\infty} P(|\frac{X_n}{n} - \theta| > \varepsilon) = 0$$

is valid for each $\varepsilon > 0$.

- ► The law of large numbers constitutes the foundation of the statistical concept of probability.
- Practical application of the law: Suppose the very same experiment is conducted with a sufficiently larger number of repetitions. With increasing n, the sample mean of this repetitions will approach the theoretical mean.

Ertz | Elements of Statistics

| WiSe 2021/22 41 / 61 @ WiSoStat

7. Selected distributions | 7.3 Limit theorems and approximation condition

Central limit theorem

Assume $\{X_n\}$ to be a sequence of independent random variables with existing and positive variances. In addition,

$$Y_n := \frac{\sum\limits_{i=1}^n (X_i - \mathsf{E}\,X_i)}{\sqrt{\sum\limits_{i=1}^n \mathsf{Var}\,X_i}}$$

is the standardized sum variable and the random variable Y follows a standard normal distribution. The sequence of random variables $\{X_n\}$ satisfies the *central limit theorem* if

$$\lim_{n\to\infty} F_{Y_n}(x) = \int\limits_{-\infty}^x \frac{1}{\sqrt{2\pi}} \cdot \exp\Big(-\frac{1}{2} \cdot s^2\Big) \, ds \ .$$

7. Selected distributions | 7.3 Limit theorems and approximation conditions

Wideshafts and Conjulatoristical

Theorem of De Moivre and Laplace

The random variables X_i are bernoulli-distributed with parameter θ (0 < θ < 1) and stochastically independent. The resulting sequence $\{Y_n\}$ satisfies the central limit theorem.

 $b_X(4|10;0.5) = 0.2051$

 $\Phi_X(4|5;2.5) - \Phi_X(3|5;2.5) = 0.1606$ $\Phi_X(4.5|5;2.5) - \Phi_X(3.5|5;2.5) = 0.2045$

Ertz | Elements of Statistics

| WiSe 2021/22 43 / 61 © WiSoStat

7. Selected distributions | 7.3 Limit theorems and approximation condition

Theorem of Lindeberg and Lévy Wirtschafts- und S Universitä

 $\{X_n\}$ being a sequence of independent identically distributed random variables with existing and positive variances. Thus the sequence $\{X_n\}$ satisfies the central limit theorem.

- In contrast to the theorem of de Moivre and Laplace, there is no specific distribution required
- ▶ In practice, approximations for n sufficiently large
- Convergence is reached despite of very different distributions
- ► Technically only applicable to sampling models with replacement
- There are numerous other central limit theorems

7. Selected distributions | 7.3 Limit theorems and approximation conditions

Continuity correction binomial approximation

$$\begin{split} P(X \leq x) &= B(x|n,\theta) \\ &= \Phi\big(x + 0.5|n\theta, n\theta(1-\theta)\big) \\ P(x_1 < X \leq x_2) &= B(x_2|n,\theta) - B(x_1|n,\theta) \\ &= \Phi\big(x_2 + 0.5|n\theta, n\theta(1-\theta)\big) - \Phi\big(x_1 + 0.5|n\theta, n\theta(1-\theta)\big) \\ P(X \geq x) &= 1 - B(x - 1|n,\theta) \\ &= 1 - \Phi\big(x - 1 + 0.5|n\theta, n\theta(1-\theta)\big) \\ &= 1 - \Phi\big(x - 0.5|n\theta, n\theta(1-\theta)\big) \\ P(x_1 \leq X \leq x_2) &= B(x_2|n,\theta) - B(x_1 - 1|n,\theta) \\ &= \Phi\big(x_2 + 0.5|n\theta, n\theta(1-\theta)\big) - \Phi\big(x_1 - 0.5|n\theta, n\theta(1-\theta)\big) \end{split}$$

Ertz | Elements of Statistics

| WiSe 2021/22 46 / 61 © WiSoStat

7. Selected distributions | 7.3 Limit theorems and approximation conditions

Example 7.14: Continuity correction (1)

The sample site $\it n=100$ and the parameter $\it \theta=0.36$ re given. Initially, the conditions of approximation have to be checked.

$$100 \cdot 0.36 \cdot 0.64 = 23.04 > 9$$

Now we have $\mu = 100 \cdot 0.36 = 36$ and $\sigma^2 = 23.04 = 4.8^2$.

Calculation of μ and σ^2 in R:

 $Mean7_14$ [1] 36

[1] 23.04

Ertz | Elements of Statistics

| WiSe 2021/22 47 / 61 © WiSoStat

7. Selected distributions | 7.3 Limit theorems and approximation conditions

Example 7.14: Continuity correction (2)

With this, we get

$$P(X \le 40) = B(40|100; 0.36)$$

$$\approx \Phi(40.5|36; 4.8^2) = \Phi(0.94) = 0.8257,$$

Three possible ways to calculate $P(X \le 40)$ in R:

round(Prob7_14_1, 4) round(Prob7_14_3, 4) [1] 0.8261 [1] 0.8257

Ertz | Elements of Statistics | WiSe 2021/22 48 / 61 © WiSoStat

Notes

Notes

Example 7.14: Continuity correction (3)

Notes

... as well as

$$P(X \ge 40) = 1 - B(39|100; 0.36)$$

$$\approx 1 - \Phi(39.5|36; 4.8^2) = 1 - \Phi(0.73) = 0.2329.$$

Three possible ways to calculate $P(X \ge 40)$ in R:

Prob7_14_4 <- 1 - pbinom(q=39, size=n, prob=Theta7_14)
Prob7_14_5 <- 1 - pnorm(q=(39.5-Mean7_14)/sqrt(Var), mean=0,sd=1) Prob7_14_6 <- 1 - pnorm(q=39.5,mean=Mean7_14,sd=sqrt(Var)) round(Prob7_14_4, 4) round(Prob7_14_6, 4)

Suppose a hypergeometric distribution (model without replacement, N=1000, hence $0.1\ll1)$ is used instead, the additional correction factor would lead to an approximation by N(36; 20.76).

7. Selected distributions | 7.5 Sampling distributions

Representativeness of samples

A sample is called representative with respect to a population if its result can be transferred to the population in a suitable manner, e.g. it represents the same properties and proportions as that of the population of interest.

- ▶ Small image of the population
- ▶ Structures of the characteristics of interest have to be borne in mind
- Sampling frame has to be known and accessible
- Random sampling with known inclusion probabilities
- One should be aware of non-sampling errors
- A suitable estimation methodology is required

Sampling functions and distributions

A sample function is a function

$$u(x_1, x_2, \ldots, x_n)$$
,

which evaluates the realisations of a variable of interest observed in a sample.

Examples:

- ▶ Sample mean: \overline{x}
- ► Sample proportion: *p*
- ► Sampling variance: s²

Which distributions do these sample functions follow?

Distributions of the random variables \overline{X} , P and S^2 , respectively.
